WHISPERSTREAM PRIVACY POLICY

Version 1.0

Effective 2026-10-22

This Privacy Policy explains how Lanreal Technologies Inc. ("Lanreal," "we," "us," or "our") collects, uses, shares, and retains personal information in connection with the Whisperstream desktop application for Microsoft Windows (the "Software"). It also describes the rights you have with respect to that personal information and how to exercise them.

1. INTRODUCTION AND SCOPE

Whisperstream is a local, on-device dictation application for Microsoft Windows. It captures microphone audio when you press a push-to-talk hotkey, transcribes that audio on your own computer using a speech recognition model that runs entirely on your CPU, and types the resulting text into the focused window. Speech recognition runs on your device. The source edition is free of charge and includes all features without activation. It does not validate licenses or submit in-app ratings, reviews, feedback or feature requests. This policy applies whether you build the Software from source or install it with the official installer. Built from source, it makes no application-update requests; installed from the official installer, it checks for signed updates (Section 3.2).

App-managed model downloads use pinned public Hugging Face URLs, with GitHub release archives available as a verified backup for supported speech models. Kokoro model downloads use Hugging Face only. These requests disclose your IP address, ordinary HTTP headers and the requested model URL to the serving hosts and their delivery infrastructure. There is no remote model-availability manifest, and no build requests an online cloud-model list. Other data may leave your device when you deliver text to a destination application, enable optional cloud cleanup, or open external help (Section 3.12).

Imported audio remains local, although its resulting transcript may enter cloud cleanup if you enabled it. Agent Speak exchanges content with Codex or Claude Code over the local loopback interface; the selected coding assistant separately controls transmissions to its configured model provider. Each flow is described in detail in this Privacy Policy.

This Privacy Policy covers the Whisperstream desktop application only. It does not cover the marketing website at whisperstream.io, which is governed by a separate website privacy notice published at https://whisperstream.io/privacy-website. If you reached this document from the marketing site, please refer to the website privacy notice for information about how the site itself is operated.

Privacy notices for other Whisperstream editions are linked from https://whisperstream.io/privacy. This policy does not waive an earlier applicable privacy commitment or other binding obligation.

In this Privacy Policy, 'personal information' means information about an identifiable individual, encompassing 'personal data' as defined by the GDPR (Article 4(1)), 'personal information' as defined by the CCPA (Cal. Civ. Code s.1798.140(v)), and 'personal information' as defined by Canadian federal privacy law (s.2(1)).

2. WHO WE ARE

This policy describes Lanreal's handling of personal information and features you operate on your device. Lanreal is responsible for processing it determines for its own purposes, including official software delivery, agreement evidence and information it receives or retains for correspondence, privacy requests and claims. The company is:

Lanreal Technologies Inc. 18 King Street East, Suite 1400 Toronto, Ontario M5C 1C4 Canada

Lanreal is a corporation incorporated under the Business Corporations Act (Ontario). Our registered office is in the Province of Ontario, and our operations are governed by Canadian federal and provincial law applicable

therein.

Privacy Officer designation. In accordance with Canadian federal privacy law (the Personal Information Protection and Electronic Documents Act), Lanreal Technologies Inc. has designated a Privacy Officer responsible for compliance with this Privacy Policy. The Privacy Officer can be contacted at support@whisperstream.io. Throughout the remainder of this document, "Canadian federal privacy law" refers to the statute named above.

Where the GDPR applies, Lanreal acts as controller for its own processing described above. Sections 4 and 6 distinguish it from your use of the installed tool and your provider's services. Canadian and California responsibilities depend on the actual activity and applicable law. We preserve all rights and commitments in this policy, including the California rights we offer regardless of whether statutory business thresholds apply.

All privacy-related communication, including data subject rights requests, complaints, and general questions about this Privacy Policy, should be directed to support@whisperstream.io. This is Lanreal's single privacy contact channel for the Software.

EU Representative. Lanreal has not designated an EU representative. You may contact Lanreal directly at support@whisperstream.io about your personal information. This direct contact does not substitute for a representative where Article 27 requires one. We will update this notice if a representative is appointed.

3. INFORMATION WE COLLECT

The Software is intentionally narrow in the information it handles. This section enumerates every category of information associated with your use of the Software, in the order in which the underlying network activity happens.

3.1 Official installer request

The free official installer is provided after you complete a contact form on the Whisperstream website. Information you submit through that form is collected by the website and governed by the separate website privacy notice identified in Section 1. The installed Software does not transmit or require that information. Building from source requires no form.

3.2 Application updates

How you get the Software changes only the requests in this section.

Built from source. The Software makes no automatic or manual application-update requests. To update, choose a newer source revision and rebuild it using that revision's instructions.

Official installer. After setup, the Software checks for a signed update at most about once a day, and when you choose to check from About. It downloads and installs an update only after you accept it, and verifies the update's signature first. Update requests go to Lanreal storage hosted by Cloudflare (R2). They disclose your IP address, ordinary HTTP headers including the client library's User-Agent, and the requested file. They do not include audio, transcripts, prompts, API keys, account or device identifiers, or your settings. Lockdown stops these requests.

Opening the Source code link launches your browser at the repository without attaching application data. GitHub receives the browser connection and any account or service-usage information governed by your browser session and GitHub's policy. Section 3.12 describes external handoffs.

Update choices do not affect local dictation with installed compatible models. Model download routes are described in Section 3.3.

3.3 Speech-recognition model download data

During setup, or after you select a language or speech-recognition engine, the Software downloads the required model if it is not already installed. Parakeet, Qwen and Cohere model files use pinned public Hugging Face URLs. Requests can redirect through Hugging Face's file-delivery infrastructure, including its Xet/CDN delivery hosts. For Parakeet v2/v3, Qwen and Cohere, if the source remains unavailable after retries, the Software tries the matching upstream sherpa-onnx release archive at github.com and release-assets.githubusercontent.com. The archive is verified against a packaged checksum before extraction and required files are verified before installation. Cancellation, disk, integrity and download-policy failures do not trigger a backup. The serving hosts receive your IP address, ordinary HTTP headers including the download library's User-Agent, and the requested URL, which identifies the model.

These public downloads connect directly from your device to the upstream file hosts and their delivery infrastructure. They do not use your browser session or import your browser cookies or Hugging Face token cache. A delivery host may set cookies within the download client's own connection session. These model-download requests do not send upstream host logs to Lanreal. The app keeps local diagnostic events about downloads and does not upload them automatically. If you separately share a diagnostic export, Lanreal receives it as correspondence under Section 3.13. The Software does not attach a Hugging Face authentication token, Lanreal account identifier, license key, device identifier, microphone audio, transcript, generated speech or cloud-provider API key to these requests. Each file is verified locally against a pinned cryptographic checksum before installation. The model catalog is packaged with the app; opening model settings does not request an online availability manifest. Already installed compatible models remain usable without a replacement download.

Cohere Transcribe performs speech recognition on your device. Its model URL identifies the Cohere artifact, but your selected language remains local and is not included in the request. No audio or transcript is sent to Cohere or Hugging Face or GitHub for speech recognition. Optional cloud cleanup is separate (Section 6). Model-host roles and international transfers are described in Sections 5 and 7.

3.4 Data that stays on your device

The following information is handled on your own computer and is not transmitted to Lanreal. User-directed delivery to a destination application and the optional outbound flows identified below are the specific exceptions to local-only handling:

- Audio recordings. Microphone audio is held in random-access memory while each push-to-talk capture is transcribed on your CPU, and is never uploaded to any server. If you keep the local transcript history enabled with audio saving on (both are on by default, and both can be turned off), a copy of the recording is also stored, encrypted, on your own device, as described in the "Local transcript history" entry below. No audio data is ever transmitted off your device.

Voice data is not biometric data. The speech recognition model processes your voice solely to convert speech into text. It does not create a voiceprint, does not perform speaker identification or authentication, and does not extract or store any biometric identifier from your voice. Under the GDPR (Article 9), biometric data is subject to enhanced protections only when processed for the purpose of uniquely identifying a natural person. Because the Software processes voice exclusively for transcription and not for identification, the voice data handled by the Software does not constitute biometric data within the meaning of Article 9.

- Transcribed text. The text produced by the speech recognition model is typed into the window you have focused. If you keep the local transcript history enabled (it is on by default and can be turned off), the transcribed text (both the raw transcript and, if you use the optional AI cleanup feature, the enhanced version) is also stored, encrypted, on your own device, as described in the "Local transcript history" entry below. Transcribed text is never transmitted to Lanreal or retained by Lanreal in any form. - Local transcript history. The Software keeps a searchable history of your past dictations on your own device so that you can review, copy, and replay them. This history is enabled by default and can be fully disabled. It stores your transcribed

text (the raw transcript and, where you used AI cleanup, the enhanced version) and, when audio saving is enabled, the recorded audio. The transcribed text and the audio are encrypted at rest using AES-256-GCM. The AES data key is protected with Windows user-scoped DPAPI. Windows normally limits decryption to the protecting user's credentials on that computer; a roaming profile can permit decryption on another computer. This protection does not isolate the key from processes acting with that user's authority. The raw transcript, enhanced transcript, saved audio, and waveform peaks used by the player are encrypted separately. Lightweight index metadata (such as a record identifier, timestamp, duration, model name, source type, and relative audio-file location) is stored unencrypted so the list can be sorted and displayed without decrypting its content. The history is kept inside your Windows user profile under %LOCALAPPDATA%\Whisperstream\ (a transcripts.db index and a recordings\ folder). History is not uploaded automatically. You may separately copy or export content, or explicitly request cloud reprocessing as described in Section 6. You control it: a master "Save transcripts" toggle and a separate "Save audio" toggle let you keep a text-only history or turn history off entirely, and a retention window (1, 7, or 30 days, or forever, with 7 days as the default) automatically removes older entries. You may also delete an individual entry or clear the entire history at any time. See Section 8 for retention and deletion details. - Local diagnostic logs. In ordinary use, voluntary Lockdown Mode, and administrator-managed Lockdown Mode, the Software writes content-free operational events to a local whisperstream.log file under %LOCALAPPDATA%\Whisperstream\logs\. The active file and up to three backups are each limited to approximately 2 MiB. The Software excludes transcript, voice/audio, and Agent Speak content; passwords; recovery codes; API, transcript-encryption, and license keys or secrets; full email addresses; foreground process identity; imported-audio filenames and paths; browser hosts; and raw error text that could carry user content. Each application window also keeps a bounded in-memory frontend log buffer (up to 500 entries, 2 KiB per entry, and 128 KiB total). The backend re-sanitizes synchronized frontend entries and keeps at most 128 KiB across windows in process memory. A supplemental Lockdown diagnostic file accepts only code-defined event and field names, retains at most 256 events and 128 KiB, and contains no arbitrary user-supplied strings. These logs are never transmitted automatically. Lockdown does not pause, clear, or disable the diagnostic log, frontend capture, or support export. - Usage statistics. The Software keeps aggregate counters of how many transcriptions you have run, how many words you have transcribed, and how much recording time you have accumulated. These counters are stored locally in your Windows user profile and are never transmitted. - Configuration. Your settings, including your chosen hotkey, audio device, and word-override dictionary, are stored locally in a configuration file under your Windows user profile and are not transmitted, except that matching Boost terms from your Dictionary are included in optional cloud cleanup requests (Section 6.2). - Lockdown access log. While Lockdown Mode is effective, the Software keeps a separate content-free access log that records the time and an allowlisted operation type for transcript-history access and Lockdown state changes, together with a sanitized short record identifier when applicable. It never records transcript or audio content, your password or recovery code, or health information. The active access.log file and up to five backups are each limited to approximately 2 MiB. This audit log is stored only under %LOCALAPPDATA%\Whisperstream\logs\, is not included in support exports, and is not created for ordinary transcript operations outside Lockdown Mode.

Lanreal does not automatically receive the local stores described in this Section 3.4. Particular content may nevertheless leave your device through a separate, user-directed flow described elsewhere in this Policy: finished text is delivered to the destination application under Section 3.10; a transcript may be sent to the cloud-cleanup provider you configure under Section 6; an Agent Speak reply is returned to Codex or Claude Code under Section 3.11. Those recipients control their own copies under the terms identified in the applicable section. If you choose to download a diagnostic archive, the backend builds it in memory and streams it to the destination you select; it does not write an app-managed ZIP file. That downloaded copy is under your control. If you then send it to Lanreal as part of a bug report (for example, by attaching it to an email to support@whisperstream.io), Lanreal processes the information you send to diagnose the issue and retains it under the retention criteria and prior applicable commitments described in Section 8.

A summary of the categories above, mapped to the CCPA categories of personal information, is provided in Section 13 of this Privacy Policy.

3.5 GitHub star prompt

After sustained use, the Software may occasionally ask whether you are enjoying it. Yes offers Star on GitHub, which opens the repository in your browser. Not really offers Open an issue, which opens the GitHub issue chooser. The app collects no rating, feedback text, identity, transcript or version, prefills nothing and uploads nothing. A local review_state.json file records only a session count, the dates on which the app was used, and when the prompt was shown, dismissed or acted on, so the prompt stays occasional. It is never transmitted. The prompt never appears in Lockdown Mode. Starring or filing an issue is a separate action in your browser; GitHub's handling is described in Sections 3.12 and 5.

3.6 Lockdown Mode (optional hardening)

Lockdown Mode is an optional setting you can turn on to harden the Software for privacy-sensitive and HIPAA-conscious workflows. It is off by default. Lockdown Mode is designed to support HIPAA-conscious workflows; it is not a HIPAA certification, it does not make the Software HIPAA compliant, and it does not replace your own compliance obligations. When Lockdown Mode is on:

- AI cleanup runs on your device only. The cloud providers and self-specified endpoints described in Section 6 are disabled, and AI cleanup is forced to the on-device model, so Whisperstream does not send that transcript to a configured cleanup provider. - Your transcript history is locked behind a password. A key derived from a password you choose additionally wraps the transcript encryption key, on top of the AES-256-GCM encryption at rest and the Windows Data Protection API sealing already described in Section 3.4 (see Section 12 for the details). A one-time recovery code is created when you turn Lockdown Mode on and is the only other way to unlock your history. The history locks again automatically after an idle period you set, and repeated failed unlock attempts trigger escalating delays. - Or you can choose to save nothing. Instead of a password-protected history, you may turn Lockdown Mode on without saving transcripts at all, in which case no transcript history is written to your device. - Safe diagnostic logging remains available; the content-free access log is separate. The bounded local diagnostics described in Section 3.4 remain active so you can troubleshoot problems and prepare a useful bug report. The separate local access log records allowlisted transcript-history and Lockdown operations (never their content) and is not included in support exports. Whisperstream never uploads either log automatically.

Data-loss warning. Your Lockdown Mode password and your recovery code are held only on your own device. Lanreal never receives your password, your recovery code, or your transcripts. If you set a transcript password and lose both your password and your one-time recovery code, you will not be able to unlock your transcript history through the Software, and Lanreal cannot unlock or recover it for you. There is no Lanreal-side backup. The Software offers a destructive reset that removes the still-locked transcript history through ordinary database and file deletion and turns off Lockdown Mode; it cannot restore the old records or securely overwrite the storage device.

In Lockdown Mode, Whisperstream's audio, transcription, history, and AI cleanup pipeline stays on your device and Lanreal never receives that content. Lockdown Mode does not prevent the text from being delivered to the destination application you selected. It blocks Whisperstream's Agent Speak integration, but does not control the independent coding agent's provider connection. Those destinations handle data under their own terms. The warranty and preserved-rights provisions are in Section 6 of the bundled open-source license and processing notices. Lockdown Mode is not a HIPAA certification. For this on-device workflow, Lanreal is not a business associate and there is no Business Associate Agreement to sign. Turning Lockdown Mode off and choosing a cloud AI provider would send transcribed text to that provider and change this; Lockdown Mode blocks the cloud providers to keep the Whisperstream pipeline on your device.

3.7 Optional voice feature model downloads

Whisperstream includes an optional voice feature that reads an artificial-intelligence coding assistant's text replies aloud on your device. The feature is off by default and does nothing until you turn it on.

Supertonic 3 INT8 is the default voice engine in the open-source edition. A complete Kokoro model already cached on your device remains usable in standard builds, including through an existing Kokoro or Automatic selection. Only new Kokoro downloads require experimental opt-in. If an existing Kokoro selection has no complete cached model, it changes to Supertonic; the speech-enabled setting and existing files are preserved. The engines have different voices and output characteristics. The app requires the processing acknowledgment before it processes content.

If a required voice model is absent, enabling the feature downloads it, subject to the experimental opt-in required for new Kokoro downloads. Supertonic and Kokoro files use pinned public Hugging Face URLs. Kokoro has no automatic backup host. Compatible complete Kokoro caches remain usable. Kokoro files include model weights, voice embeddings, an English lexicon and supporting eSpeak language data under their respective licenses. These model requests use the delivery infrastructure described in Section 3.3. The hosts receive your IP address, ordinary HTTP headers and the model-specific URL. No spoken text, generated audio, license key, account information, authentication token or device identifier is attached. Files are verified against pinned checksums before installation.

The Voice Models run entirely on your device. The Software does not transmit the text sent to the Voice Models or the audio they generate off your device for speech synthesis. Lanreal does not receive that text or audio and sends no separate feature-use telemetry. The model host can retain the ordinary access-log record described in Section 8, which can show that a model-specific file was requested. Turning the feature off stops the Software from using the Voice Models. You can remove a downloaded model from your device by deleting its applicable model directory under %LOCALAPPDATA%\Whisperstream\models\. If you selected a custom model storage location, delete the corresponding models or local-llm directory from that custom location instead.

The Voice Models have different third-party license terms. The upstream Kokoro model and lexicon use Apache License 2.0; its eSpeak language data is separately GPL-3.0-or-later. Its official native runtime also includes separately licensed eSpeak/Piper components. Kokoro is not subject to the Supertonic behavioural use restrictions described below. If you download, enable, or use Supertonic 3, your use of that model is subject to its OpenRAIL-M behavioural use restrictions. Those restrictions are set out in Section 5 of the bundled open-source license and processing notices and reproduced in full in the THIRD_PARTY_LICENSES.txt file bundled with the Software.

3.8 Optional on-device AI cleanup model download

Local cleanup can use Stream-1 Mini by Whisperstream, the default, or Gemma 4 E2B Instruct (Customizable). Stream-1 Mini is Lanreal's dictation-cleanup model, fine-tuned from Qwen3-0.6B-Base. When you set up Local cleanup, the Software can download missing model files for the models you select from pinned sources and benchmark each model independently on your Device. The download hosts receive the connection information described in Section 3.3, including the requested model URL. Download requests do not include your transcript, cleanup instructions, user-supplied context, license key, account information, authentication token or device identifier. Files are verified locally before installation. Stream-1 Mini downloads from Lanreal's whisperstream/stream-1-mini Hugging Face repository at a pinned revision and is verified against a pinned size and SHA-256 checksum. Unsloth Gemma files use pinned Hugging Face URLs; if Unsloth remains unavailable after retries, Gemma can fall back to Google's pinned QAT artifact on Hugging Face. That artifact has different bytes and may produce different results. Cancellation, integrity, disk and policy failures do not trigger fallback. Stream-1 Mini has no automatic backup. The models and benchmarks run locally. Local cleanup with Stream-1 Mini processes your dictation entirely on your Device; it does not send your dictation to Lanreal or Hugging Face. Cloud provider choices use the catalog packaged with the app; no build fetches an updated list. User-configured cloud processing remains governed by Section 6.

3.9 Acceptance state and other local edition records

If another Whisperstream edition previously ran under the same Windows account, this edition uses the same application data directory and continues to use its settings, models, transcript history and legal-acceptance ledger. Licensing, trial or activation records left by that edition, including under HKCU\Software\Whisperstream, are not read, modified or transmitted and do not limit functionality. They remain until you remove them as described in Section 8.

The Software stores local records of the EULA version and content hash you accepted, the acceptance time, the Software version, the type of acceptance event, and any cloud-processing consent. EULA acceptance evidence is kept in an append-only local ledger: accepting a later agreement updates the current acceptance fields while preserving earlier exact acceptance records in the same file. These records are used to identify the current legal notice and consent state. They are not sent to Lanreal.

3.10 Imported audio, app/site routing, and text delivery

When you import audio, the Software reads and decodes each file in place, transcribes it on your device, and stores the resulting entry under the same history settings as a microphone dictation. The selected path is used only while the import is active; its base filename may be shown in the active progress interface but is not written to diagnostics. The Software does not modify, delete, or make a plaintext path-based copy of your source file. If cloud AI cleanup is enabled, the resulting transcript may be sent to the provider you selected under Section 6. The imported audio itself is not uploaded.

Foreground and browser information is read only when a configured app or site rule, manual route, or destination-delivery operation can use it. App routing uses local process identity. A configured browser site rule may cause the Software to read only the normalized active host from a supported browser's address bar; it does not collect the full URL through this route. No foreground or host probe is performed when routing cannot affect the current operation. These transient values are not written to diagnostics or sent to Lanreal. The app paths and host rules you choose to save remain in your local settings.

When you choose a site-routing rule, the Software may read matching favicon data from the local Chrome, Edge, or Firefox favicon database to display the rule. It first uses a read-only database connection. If the browser has locked that database, it may create an attributable copy in the operating-system temporary directory. The Software closes the copy and makes up to three ordinary deletion attempts after use. At startup and before creating another owned copy, it also tries to remove only attributable Whisperstream copies older than 24 hours. A copy can remain longer after a crash or repeated deletion failure; the Software does not broadly delete older unattributable browser-database copies. It does not send the database, host, or favicon to Lanreal or a network favicon service.

Whisperstream delivers finished text to the focused destination application using a clipboard paste or simulated keystrokes. The destination application then receives and controls that text under its own privacy and retention practices. Lockdown Mode does not prevent this user-directed delivery.

3.11 Agent Speak and coding-agent interactions

Agent Speak provides optional, default-off connections to Codex and Claude Code. Its local plugins forward supported response text, permission context, replies, limited session identifiers and display names to the loopback backend for the HUD. Claude Code also supports structured questions and options; Codex does not provide that question flow. Speech, written summaries and provider connections have separate controls. Enabling one provider does not enable the other. Interaction content is not automatically sent to Lanreal.

Active content stays in bounded process memory and is excluded from diagnostic logs and support exports. Temporary hook questions and drafts expire under their bounded interaction windows. Optional managed terminal sessions can retain the selected session's response and draft while that session remains registered; temporary hook expiry is not a retention limit for those sessions. Disconnecting the applicable provider, entering Lockdown, revoking EULA acceptance or shutting down clears the applicable active state. The coding

agent's own files and terminal session are separate and may remain.

For display names and supported integration, Whisperstream may read a limited tail of an eligible local coding-agent transcript or reduce a working directory to its base name. Names and paths can be sensitive. Display state remains local and is excluded from diagnostics and exports. Local discovery and managed-session capability files contain connection details, including a per-run token. They are not content archives. Processes running as your Windows user may read them; this is not isolation from other same-user processes.

A reply you dictate is saved as an agent_reply entry only when Save transcripts is on, using ordinary encrypted history retention. Other agent interaction content is not written to Whisperstream transcript history. Optional wrappers deliver your chosen reply into the selected agent's terminal; the agent may then send it to its configured provider or retain it under its own practices. Its terms and privacy notice govern that separate processing. Lockdown blocks Whisperstream's agent integration and optional cloud cleanup, but does not close the independent agent process or control its own network.

3.12 External help, source access, bug reports and feature requests

Report a bug opens the GitHub bug-report form in your browser. Request a feature opens the GitHub feature-request form. Read documentation opens https://whisperstream.io/docs; Source code opens the GitHub repository. These actions occur only after a click and are unavailable in Lockdown Mode. The app does not prefill a transcript, log bundle, account or device identifier, message body, or diagnostic attachment, and does not automatically send a report.

The destination receives ordinary browser connection and session information. If you submit an issue, GitHub and repository maintainers receive the account identity, text and files you choose to share. Public issues and attachments can be read or copied by others. GitHub's privacy statement is linked in Section 5; website visits follow the separate website notice in Section 1. Email is sent only when you send it in your mail application, which uses your configured mail provider. Lanreal receives the sender details, message and attachments you send.

Download logs saves a local ZIP and uploads nothing. Review its contents before sharing. The GitHub issue forms offer support@whisperstream.io for private reports or logs, with an existing issue link when applicable. Report security vulnerabilities by email instead of a public issue. Do not submit transcripts, credentials or sensitive personal data. If we become aware of GDPR Article 9 special-category information in a submission to Lanreal, we delete or restrict it as reasonably practicable, subject to applicable legal retention obligations. Deleting a submission does not guarantee deletion of copies retained by GitHub or other people.

Lanreal uses voluntary bug reports to investigate problems and feature requests to evaluate and respond to proposed improvements, subject to the purpose limits, rights and retention rules in Sections 4, 8 and 10. Posting a request does not guarantee implementation or a response. Closing an issue does not delete it, its attachments, or copies made by other people.

3.13 Correspondence and privacy requests

If you contact Lanreal, we receive the contact details, message and any attachments you choose to send. We use this information to address your request and resolve related claims. Do not send API keys, passwords or unnecessary sensitive content. Local diagnostic exports are not automatically uploaded or sent to AI tools.

We use Gmail (Google) and Resend to send and receive email.

We also use individual consumer subscriptions to OpenAI (ChatGPT and Codex) and Anthropic (Claude), not business or API plans, to help review some messages and draft replies. This can make the message and attachments we submit available to those providers. They are not Lanreal's processors for this use, and no data processing agreement covers it. Each provider handles that content under its own consumer terms and privacy policy, may retain it, and, depending on those terms and our account settings, may use it to improve its

models.

You can ask us not to use these AI tools for your message, in that message or at any time; we then handle it without them. If you are in the European Economic Area, the United Kingdom or Switzerland, we submit your message to these AI tools only with your explicit consent (Section 7). This support workflow is separate from the app's optional BYOK feature and its provider permissions. Contact support@whisperstream.io about our handling of correspondence.

4. WHY WE PROCESS YOUR INFORMATION

The purposes and GDPR Article 6 bases below describe current operation. A lawful basis for processing does not itself establish an international-transfer mechanism; see Section 7.

- Voluntary bug reports, feature requests and private contact. Lanreal processes the details you choose to send to investigate problems, evaluate proposed improvements and respond to the matter you raise, under Article 6(1)(f), its legitimate interest in maintaining and improving the Software. Public reports are optional; private contact remains available. Your objection and other rights are described in Section 10. GitHub and your mail provider separately control their service processing under their applicable policies.

- Model-download connection information. For public Hugging Face and GitHub downloads, the installed tool contacts the file host directly when you request a missing model. Those hosts collect connection information from your device and determine their own purposes and legal bases under their policies. Lanreal supplies the download tool and selects verified model files; it does not engage these hosts to process customer records on its behalf. Installed local models do not require recurring model-host communication for inference. - Official updates. In the official installer build, Lanreal processes the connection information in Section 3.2, through Cloudflare, to deliver signed updates you accept, under Article 6(1)(f), its legitimate interest in keeping the Software secure and current. Builds from source make no such request. - Features you operate. Local capture, transcription, cleanup, history and delivery serve the purposes for which you or your organization use the Software. You select the content and its use. We explain these operations for transparency; not every local file is processed for Lanreal's purposes. Organizations remain responsible for their own lawful basis and safeguards. - Agreement evidence and support. The local acceptance record operates on your device as part of the Software, and the ordinary app does not upload it. Lanreal processes acceptance information only if you send it to us, under Article 6(1)(f), its legitimate interest in accurate agreement evidence. Information you separately send for support is processed for our legitimate interest in addressing your request under Article 6(1)(f), subject to Sections 3.13 and 8. Using the consumer AI tools described in Section 3.13 to help draft a reply relies on the same interest, subject to your right to ask us not to use them; Section 7 describes the explicit consent we obtain for senders in the European Economic Area, the United Kingdom or Switzerland. Other surviving duties are addressed below. - Optional provider features. You choose whether to use cloud cleanup and which provider or endpoint to engage. The installed tool constructs requests with built-in or configured instructions; connection checks are separate requests described in Section 6.2. Feature permission governs what the app may send. It does not supply a lawful basis for every person's information you submit or determine the provider's legal basis. The permission and withdrawal controls remain binding regardless of this role distinction.

- Surviving rights and obligations. Lanreal processes GDPR rights requests under Article 6(1)(c) to meet Articles 12-22; and necessary claim records under Article 6(1)(f) to establish, exercise or defend claims. Article 6(1)(c) applies only where the obligation has the Union or Member State legal foundation Article 6(3) requires. Other retention obligations require their own appropriate basis. Section 8 describes retention criteria; retaining information does not erase rights or permit unrelated new uses.

Obligation to provide personal data. The open-source edition requires no license key, hostname submission or activation to unlock functionality. Downloading missing models necessarily exposes ordinary connection information to the serving hosts. Optional cloud cleanup is not required for local dictation; disabling it stops that cloud processing without removing local functionality. No statutory obligation requires you to provide the optional information described here. Lanreal does not engage in automated decision-making or profiling

producing legal or similarly significant effects under GDPR Article 22.

You choose whether to contact us for ordinary support. If you withhold information reasonably needed to understand a request, we may be unable to assess or complete it. For privacy requests, we seek only information necessary to locate the relevant records or, where needed, verify your identity. No account is required. Mandatory legal rights and remedies remain preserved.

5. WHO WE SHARE IT WITH (SERVICE PROVIDERS AND OTHER RECIPIENTS)

This list covers the delivery hosts, chosen GitHub visits and reports, and services holding records described in Section 3. Hugging Face and GitHub serve public model downloads in every build. Cloudflare hosts the official installer build's update requests. Some act as processors on Lanreal's behalf; others determine their own purposes for limited connection data as identified below. The list covers those application flows. Section 6 separately identifies optional cleanup providers and endpoints, the requests they receive and their direct relationship with you. Changes to this list are communicated via version bumps to this Privacy Policy (see Section 14), and are also published in advance via the public provider page and RSS feed described in Section 14. In accordance with Principle 4.1.3 of the Personal Information Protection and Electronic Documents Act, Lanreal uses contractual and other means to ensure that each listed recipient acting as a processor on Lanreal's behalf provides a comparable level of protection for personal information transferred for processing. Lanreal remains accountable for the protection of personal information transferred to third-party processors. Lanreal does not use or disclose personal information for purposes other than those described in this Privacy Policy, unless required by law.

Correspondence under Section 3.13 uses Gmail (Google) and Resend for email. Those services can receive the contact details, messages and attachments supplied for that purpose. Their policies are at https://policies.google.com/privacy and https://resend.com/legal/privacy-policy. Lanreal remains responsible for its handling of correspondence and for processors it engages.

OpenAI and Anthropic can receive messages and attachments that Lanreal submits through its consumer subscriptions to help draft replies, as described in Section 3.13. They are not engaged as Lanreal's processors for this use and process that content as independent recipients under their consumer terms and privacy policies, at https://openai.com/policies/privacy-policy/ and https://www.anthropic.com/legal/privacy, including any model-improvement use those terms and Lanreal's account settings permit. Lanreal remains responsible for its decision to submit the content. The app's BYOK provider permissions are separate.

1. Hugging Face, Inc. (United States) -- public model delivery described in Sections 3.3, 3.7 and 3.8. Hugging Face and its delivery infrastructure receive the connection data described in Sections 3.3, 3.7 and 3.8, including downloads of Stream-1 Mini and Gemma for local cleanup. Hugging Face determines its own purposes for operating, securing and maintaining its services and acts as an independent controller for those uses. Its privacy policy is at https://huggingface.co/privacy. The installed tool requests files directly from the upstream host as described in Section 3.3. International processing and host-controlled retention are described in Sections 7 and 8.

2. GitHub (United States / Netherlands) -- speech-model backup delivery, source access, bug reports and feature requests you choose to open in your browser. GitHub receives the model connection data in Section 3.3 or browser, account and submitted information described in Section 3.12. Its privacy statement describes independently controlled service usage data and is available at https://github.com/site/privacy. International processing and host-controlled retention are described in Sections 7 and 8. GitHub is not engaged as Lanreal's processor for public model-download connection records.

3. Cloudflare, Inc. (United States) -- R2 hosting for the official installer build's update checks and update downloads (Section 3.2). Cloudflare receives your IP address, ordinary HTTP headers and the requested file, and acts as Lanreal's processor for that delivery. Its privacy policy is at https://www.cloudflare.com/privacypolicy/. Builds from source do not contact it.

The application recipients above are distinct from the optional providers in Section 6, correspondence processing in Section 3.13 and the legally permitted disclosures in Sections 12b and 12c. These distinctions do not change our no-advertising and no-data-broker commitments: Lanreal does not disclose personal information to advertisers, data brokers, or social media platforms, and Lanreal does not use third-party analytics, crash reporting, or error-reporting services (see Section 9 for the full enumeration of what the Software does not do).

6. OPTIONAL CLOUD POST-PROCESSING (BRING YOUR OWN KEY)

The Software includes an optional AI cleanup feature that can route transcribed text through a Large Language Model for post-processing (for example, filler-word removal, spoken-correction handling, punctuation and number normalization, style adjustment, or custom formatting). This feature is disabled by default in every new installation. When disabled, Whisperstream does not send text for optional cleanup. Delivery to your chosen destination remains separate under Section 3.10.

When you enable AI cleanup, it can run on a Large Language Model hosted on your own device, in which case your transcribed text is processed locally and does not leave your device. Alternatively, under Bring Your Own Key, you may configure the feature to route your transcribed text to a third-party cloud provider that you select, using credentials where the selected integration requires them. This Section 6 describes that optional cloud path: the providers you may select, what is transmitted, and your relationship with the provider. The on-device option involves no transmission of transcribed text and is covered by the default-state promises in Sections 3.4 and 9.

6.1 Supported providers

If you enable the optional post-processing feature, you may configure the Software to route transcribed text to any one of the following providers. Lanreal does not operate their services as a Lanreal cloud cleanup service. Your contractual relationship is directly with the provider you engage.

1. OpenAI -- a cloud-based Large Language Model provider. The contracting entity and applicable terms depend on your API account and location. See https://openai.com/policies/services-agreement/, the privacy policy at https://openai.com/policies/privacy-policy/ and the API data controls at https://platform.openai.com/docs/guides/your-data. Review the agreement, data-processing terms and controls applicable to your own account; consumer ChatGPT terms do not by themselves describe your API arrangement.

2. Anthropic, PBC (Delaware, USA) -- a cloud-based Large Language Model provider. Users outside North America may contract with a different Anthropic regional entity (for example, Anthropic Ireland Limited for users in the European Economic Area). See Anthropic's privacy policy at https://www.anthropic.com/legal/privacy and Anthropic's Commercial Terms of Service at https://www.anthropic.com/legal/commercial-terms for information on how Anthropic handles content submitted to its API.

3. Google, via the Gemini API. The contracting entity and data terms depend on your account, location and applicable service arrangement. Review the Gemini API terms at https://ai.google.dev/gemini-api/terms and Google's privacy policy at https://policies.google.com/privacy. Where Google's Unpaid Services data terms apply, do not submit personal, confidential or sensitive information; Google may use inputs and outputs for improvement and human review. Paid-service treatment and the EEA, UK and Swiss exceptions differ. Confirm your applicable terms before sending dictation. Provider eligibility restrictions, including age, business/professional purpose, region and applicable paid-service requirements, also apply; permission to use Whisperstream does not establish eligibility for Gemini.

4. A self-specified endpoint (Ollama-compatible or other OpenAI-compatible endpoint) -- a Large Language Model server that you point the Software at by supplying its URL, together with a credential where the endpoint requires one. This covers both an Ollama server through its OpenAI-compatible API and other servers

speaking that API. A localhost address means Whisperstream sends the request to a process on your device. That process may run the model locally or forward your text and instructions to a cloud service, including Ollama cloud models. Processing stays on your device only if the server and selected model operate locally without forwarding. Check their configuration, terms and privacy information before use. The bundled Local option is a separate feature. If you configure a non-local endpoint, Whisperstream sends the request to the server at that address, which may also forward it onward. The endpoint operator is responsible for its own handling; Lanreal remains responsible for its own decisions and the Software's stated safeguards.

6.2 What is transmitted

When the optional post-processing feature is enabled, for each eligible transcript the Software transmits to the provider you selected:

- The transcribed text produced by the speech recognition model, as an input to the post-processing request. Ordinary dictation cleanup skips transcripts of three words or fewer unless they contain a saved Boost term from your Dictionary. Explicit sample previews below are separate requests and can include shorter text. - An API key or credential, where required, supplied for the selected provider, as an Authorization or equivalent request header to authenticate the request. An Ollama server may use a separate sign-in managed by Ollama; that sign-in is not a credential supplied to Whisperstream. - The selected model identifier, so the provider can route the request. - Matching Boost terms from your Dictionary, when a saved Boost word is relevant to the transcript, so the provider can prefer your spelling. - Any instruction prompt that you have configured in the Software (for example, a system prompt describing the post-processing style you want), as part of the request payload. - Standard HTTP headers automatically attached by the Software's HTTP library. The recipient also sees the connection IP address.

The Software does not transmit, as part of any optional post-processing request, any of the following: your audio recording, your license key, the Whisperstream organization identifier, your device hostname, your operating system family, your local diagnostic logs, your in-memory frontend log ring buffer, your usage statistics, your configuration file, or any other category of information listed in Section 3.4 as staying on your device. These remain on your device regardless of whether the optional post-processing feature is enabled.

In addition to the per-transcript transmissions described above, while the feature is enabled and required configuration is complete, the Software periodically sends a short connectivity probe to the provider you selected to check reachability and any required credential, so that the Software can display an accurate connection status in its settings interface. The probe transmits the API credential where required, standard HTTP headers and a short fixed test prompt authored by Lanreal. The recipient also sees the connection IP address. It does not transmit any of your transcribed text, any prompt you have configured, or any other user content. The probe is covered by the same consent you give when you first enable the feature under Section 6.5, and the Software will not send a probe to any provider for which that consent has not been recorded.

6.3 Provider response handling

Explicit previews and saved-text cleanup. A prompt preview sends the sample text and instructions you select, the model identifier, applicable credential and ordinary connection information to your selected provider. Experimental saved-transcript Re-enhance can send the selected saved raw transcript for cleanup when that feature is available and you explicitly request it. These actions do not automatically upload your history. The cloud consent, disabled feature and Lockdown protections in this Section also apply to these actions.

After the provider processes your request, it returns the post-processed text to the Software as the response body. For ordinary dictation, the response is handled locally under the same delivery and history settings as other transcribed text: it is typed into the focused window and, if you keep local transcript history enabled, stored encrypted on your own device as described in Section 3.4. Preview results return to the tester; import and saved-text cleanup results return to their respective app workflows. Lanreal does not receive or retain a copy. The Software does not automatically forward the response to another cloud provider. Delivery, copying or export to your chosen destination application remains the separate user-directed flow described in Section

3.4.

6.4 Your credentials

The API key or credential you supply for any of the providers listed in Section 6.1 is stored locally on your device within your Windows user profile, under %LOCALAPPDATA%\Whisperstream\. The key is encrypted at rest using Windows user-scoped DPAPI (CryptProtectData). Windows normally limits decryption to the protecting user's credentials on that computer; a roaming profile can permit decryption on another computer. This protection does not isolate the value from processes acting with that user's authority.

The stored credential is transmitted only to the provider you selected, only over HTTPS with certificate verification enabled, and only as a request header on the post-processing requests described in Section 6.2. The Software does not transmit the credential to Lanreal, to any service provider or recipient listed in Section 5, or to any recipient other than the provider you selected. Lanreal does not receive, store, or have any ability to recover your credential.

6.5 How to enable, disable, and delete

- Enabling. The optional post-processing feature is disabled by default in every new installation. To enable it, you must explicitly select a provider or endpoint and supply a valid credential where that integration requires one, through the Software's settings interface. Before the feature begins transmitting transcribed text, the Software will display a blocking consent dialog that identifies the provider you selected, describes what data will leave your device, links to this Privacy Policy and to the provider's own privacy policy, and requires an affirmative click to continue. The Software will not begin transmitting transcribed text to any provider until you have completed all of those steps and confirmed the blocking consent dialog. - Disabling. To disable the feature, toggle it off in the same settings interface. After you disable it, the Software will not transmit any further transcribed text to any provider, and will resume the default behaviour described in Sections 3.4 and 9 of this Privacy Policy. - Deleting your credential. To delete a stored credential, use the "remove key" control in the same settings interface. This removes the encrypted credential from your Windows user profile in its entirety. - Lockdown Mode override. While Lockdown Mode (Section 3.6) is on, all of the cloud providers and self-specified endpoints listed in Section 6.1 are disabled and AI cleanup is forced to the on-device model, so no transcribed text leaves your device through the cleanup pipeline, regardless of any provider you may have configured.

6.6 Relationship to Section 5 (service providers and other recipients)

You choose whether to use cloud cleanup, select and engage the provider or endpoint, and supply its required credentials. Its agreement governs its service to you. It may process content on your or your organization's behalf and may separately process information for its own purposes under its actual terms.

Whisperstream constructs requests on your device, supplies named-provider destination mappings and uses built-in or configured instructions. Connection checks send the separate test request described in Section 6.2. Requests travel directly from your device to the selected destination, without a Lanreal server copy. Lanreal does not engage your provider to operate a Lanreal cloud cleanup service. We therefore describe it as your provider, not our processor for that service. These facts do not exclude any responsibility law assigns to Lanreal for its own decisions or information handling. Lanreal remains responsible for its privacy commitments and the Software's stated safeguards.

Your feature permission does not authorize unrelated content uses, sale or cross-context advertising. Review your provider's terms, privacy information, retention and processing locations before use. You must have the right to submit the content; an organization's requirements also apply when acting for it.

7. INTERNATIONAL DATA TRANSFERS

The hosts and services described in Section 5 can process personal information in Canada, the United States and other countries. The practices below distinguish direct public-host connections from information Lanreal processes or discloses for its own purposes. Applicable international-transfer duties follow those actual processing roles under GDPR Articles 44-49 and the relevant UK, Swiss and Canadian rules.

- Direct public-model downloads. The installed tool requests model files directly from the upstream host when you request a missing model. Hugging Face and GitHub collect the connection records described in Section 3.3 for their own service purposes. Lanreal does not engage them to process customer records on its behalf. Their delivery infrastructure can process those records in the United States and other countries. Their policies linked in Section 5 describe international processing, applicable safeguards and ways to contact them. - Hugging Face, Inc. (United States). Hugging Face identifies a French establishment and international infrastructure in its privacy information; that does not mean every download remains in the European Economic Area. Review https://huggingface.co/privacy for its independently controlled processing and rights routes. - GitHub (United States / Netherlands). Public release downloads, browser visits and voluntary reports follow GitHub's privacy statement at https://github.com/site/privacy. GitHub describes international safeguards, including participation in the EU-U.S. Data Privacy Framework, its UK Extension and the Swiss-U.S. Data Privacy Framework for covered data. Those safeguards apply within their stated scope; they do not describe every recipient or all processing by Lanreal. Public reports also disclose the account and submitted information described in Section 3.12. - Cloudflare, Inc. (United States). In the official installer build, update requests (Section 3.2) reach Cloudflare's global network, which can process connection records in the United States and other countries. Cloudflare acts as Lanreal's processor, and Lanreal remains responsible for applicable transfer duties for that processing. - Email. Google and Resend can process correspondence and supplied attachments in the United States and other countries under the applicable account terms, settings and privacy policies linked in Section 5. Their service disclosures describe processing locations and available safeguards. Lanreal remains responsible for applicable transfer duties for its handling of that information. - Consumer AI drafting tools. OpenAI and Anthropic can process messages Lanreal submits through its consumer subscriptions (Section 3.13) in the United States and other countries. No Standard Contractual Clauses or other safeguard arranged by Lanreal covers this use, and the providers may use the content under their own consumer terms. For senders in the European Economic Area, the United Kingdom or Switzerland, Lanreal therefore submits a message to these tools only with the sender's explicit consent, given after being informed of these risks (GDPR Article 49(1)(a) and the corresponding UK and Swiss rules). Without that consent, the message is handled without them.

Transfers to Canada. The European Commission's Canadian adequacy decision covers recipients subject to Canada's Personal Information Protection and Electronic Documents Act. Lanreal relies on that decision for EEA transfers to it that fall within that scope. It does not cover onward transfers from Lanreal to other countries; those require their own applicable transfer assessment.

If you are located in the European Economic Area, the United Kingdom, or Switzerland and wish to receive further information about these transfer mechanisms, including copies of the relevant Standard Contractual Clauses where available, please contact Lanreal at support@whisperstream.io.

Foreign law enforcement access. Because personal information may be transferred to service providers or other recipients in the United States for processing (as described in Section 5), that information may be accessible to the courts, law enforcement agencies, and national security authorities of the United States under the laws of that jurisdiction.

Optional provider features. A remote provider receives the requests described in Section 6. Processing locations and onward transfers depend on the provider, account and endpoint, not just its headquarters. Your provider's agreement and disclosures describe its safeguards; Lanreal does not arrange those contracts on your behalf.

International-transfer duties follow actual processing roles. An individual's direct submission of their own information differs from an organization's disclosure of other people's information. Organizations must assess transfer requirements for their use. Any duties applicable to Lanreal's own processing remain its responsibility. Ordinary EULA acceptance or feature permission alone does not establish an international-transfer safeguard or explicit consent to a derogation.

8. HOW LONG WE KEEP IT (RETENTION)

Necessary retention and surviving duties. Lanreal reviews retained personal information and deletes or anonymizes information no longer needed for a disclosed purpose or applicable legal obligation. Necessary rights-request and claim records may remain for those purposes. Privacy rights, security safeguards and breach-notification duties continue while we retain personal information. Contact support@whisperstream.io about retained information.

We retain correspondence and request-handling records under Section 3.13 for as long as necessary to address the request and document any remaining rights or claim obligation, taking account of applicable limitation periods, legal retention requirements and prior applicable commitments. We delete or anonymize information no longer necessary for those purposes. Resolving a request does not itself mean all related records or provider backups are immediately deleted. Email services can retain supplied information under their applicable account terms, settings and privacy policies linked in Section 5; processor-held copies remain subject to our responsibilities and instructions described below. OpenAI and Anthropic retain content submitted through Lanreal's consumer subscriptions under their own terms and Lanreal's account settings. Lanreal can delete those conversations from its accounts, after which the providers' retention rules apply; content already used to improve a model may not be removable from it.

Retention depends on who controls the information. The periods and deletion rules below describe local Software data and information for which Lanreal is responsible, including information processed on our behalf by service providers. Using a service provider does not remove that responsibility. We require appropriate retention and return or deletion through applicable agreements and instructions, subject to lawful retention requirements. Where a recipient separately controls information for its own purposes, its privacy policy describes its retention practices. We distinguish those roles when handling your request.

Retention for information the Software controls directly:

- Audio recordings: not retained by Lanreal, and never transmitted off your device. Microphone audio is held in random-access memory while each capture is transcribed. If you keep audio saving enabled in the local transcript history (on by default, and separately disableable), a copy of the recording is also stored, encrypted, on your own device, and is removed on the same schedule as the rest of your history (see "Local transcript history" below). - Transcribed text: not retained by Lanreal. The output of the speech recognition model is typed into the focused window. If you keep the local transcript history enabled (on by default), the transcribed text is also stored, encrypted, on your own device and removed on the schedule you set (see "Local transcript history" below). Section 6 describes optional provider requests. Ordinary dictation skips cloud cleanup for transcripts of three words or fewer unless they contain a saved Boost term from your Dictionary; explicit previews and selected saved-text cleanup are separate requests described in Section 6.3. Lanreal does not retain a copy. A provider may retain submitted content after the request ends under its terms, account settings and privacy policy (see Section 6.1). - Local transcript history (your transcribed text, encrypted waveform peaks, and, optionally, your audio): retained on your own device only, encrypted at rest (AES-256-GCM with the data key sealed by the Windows Data Protection API), and never transmitted to Lanreal. You control how long it is kept: a retention window of 1, 7, or 30 days, or forever, with 7 days as the default, removes older entries, and you may delete any individual entry or clear the entire history at any time. Retention and orphan-audio cleanup run at startup, after live and imported saves, after a retention change, and after a successful Lockdown unlock. Cleanup that requires the history key is deferred while the history is locked and retried after unlock. Deletion uses ordinary SQLite deletion and file unlinking, not secure disk overwrite. A failed file deletion may be retried by a later cleanup; database free pages or journals, filesystem remnants, backups, shadow copies, and exported copies remain outside the Software's deletion control. If the history

cannot be decrypted on your current Windows account (for example, because its protected data key cannot be opened in the current Windows environment), it is not readable and no new entries are written to it. - Local diagnostic logs: the active file and up to three 2 MiB backups are retained locally by size-based rotation in ordinary use, voluntary Lockdown, and administrator-managed Lockdown. The supplemental Lockdown diagnostic file retains at most 256 events and 128 KiB. These files are never transmitted automatically. You may delete the local log directory at any time. - Lockdown access log (Section 3.4): while Lockdown Mode is effective, the active content-free file and up to five 2 MiB backups are retained locally by size-based rotation. The Software does not assign it a time-based purge period. It is never transmitted or included in the support archive. You may delete it with the local log directory. - Frontend diagnostic buffers: each application window keeps at most 500 entries, 2 KiB per entry, and 128 KiB total in memory; the backend keeps at most 128 KiB of re-sanitized frontend entries across windows. Ring eviction or process/window exit releases that state. Lockdown transitions do not clear the rings. - Local usage statistics and configuration: retained locally on your device until you delete the relevant records or the %LOCALAPPDATA%\Whisperstream\ directory. Uninstalling the Software does not automatically delete them. - Legal-acceptance state and other local edition records (Section 3.9): retained in the current user's Windows registry and application data until you remove those records. Uninstalling does not necessarily remove them. Licensing, trial or activation records left by another edition may persist across reinstallations, but this edition does not read them or use them to restrict functionality. Exact EULA acceptance events remain in the append-only local ledger so accepting updated terms does not erase prior evidence. - Agent Speak interaction content (Section 3.11): responses, questions, permissions, display state and drafts remain in bounded process memory. Temporary hook interactions expire; managed-session response/draft state can persist while the session remains registered. Applicable disconnect, disablement, Lockdown, acceptance revocation or shutdown clears that state. Content and derived fingerprints are excluded from diagnostics and exports. Dictated replies follow encrypted transcript-history retention when enabled. The independent coding agent's storage follows its own practices. - Credentials you supply for the optional cloud post-processing feature (Section 6): retained locally on your device, DPAPI-encrypted, inside your Windows user profile, until you remove the credential through the Software's settings interface (see Section 6.5) or until you uninstall the Software and delete the %LOCALAPPDATA%\Whisperstream\ directory. Lanreal does not retain, store, or have any visibility into this credential. - Diagnostic archives and logs: the support ZIP is assembled in backend memory and streamed to your selected download destination, with no app-managed ZIP retention. The ZIP may contain recent sanitized backend and frontend diagnostics, bounded system information, and supplemental closed-schema Lockdown events. It excludes the separate Lockdown access log, transcript history, audio, imported source files, and Agent Speak stores. Your downloaded copy remains under your control. The Software never uploads the ZIP automatically; Lanreal receives it only if you separately choose to send it. Logs you voluntarily send to Lanreal with a bug report follow the retention criteria for correspondence above, including any earlier applicable commitment requiring shorter retention. They are deleted or anonymized when no longer needed for those permitted purposes. The DPAPI-encrypted credential you supply for the optional cloud post-processing feature (Section 6.4) is not part of the bug-report log export, so it is not inadvertently transmitted when you submit a bug report. - Star prompt state (Section 3.5): a local review_state.json record of session counts, usage dates and prompt outcomes, retained until you delete the %LOCALAPPDATA%\Whisperstream\ directory. It is never transmitted.

Third-party retention: processor-held and independently controlled records:

- GitHub connection data and voluntary public reports: GitHub controls retention under its privacy statement linked in Section 5; the Software does not control or delete those host-held logs. Closing a public issue does not delete its content or attachments. Lanreal-held copies remain subject to the purpose limits above; copies made by third parties are outside Lanreal's control. Contact Lanreal under Section 10 about a report it controls, or GitHub about information GitHub separately controls. - Hugging Face public-download connection logs: Hugging Face controls retention under https://huggingface.co/privacy. Its policy describes retention according to service, security and legal needs. The Software does not control or delete those host-held records, and Lanreal promises no fixed public-download log period. Retention statements for Inference Endpoints describe a different service. - Cloudflare request records (official installer build): Cloudflare retains connection records

for update requests under its service terms. Lanreal uses any it can access only to operate and secure delivery.

Retention by optional cloud post-processing providers (Section 6). If you have enabled the optional cloud post-processing feature and selected a cloud provider, your transcribed text and any instruction prompt you have configured are submitted to that provider as part of each eligible request. How long the provider retains that submitted content, whether it is used to train the provider's models, and whether it is logged for abuse detection are governed entirely by the provider's own terms of service and privacy policy, which vary by provider and by account tier (for example, some providers offer a "zero-data-retention" enterprise tier that differs from their default consumer retention). Lanreal has no visibility into and no control over retention decisions at the provider, and Lanreal does not make representations about them. Please review the provider's published policies (see the links in Section 6.1) before enabling the feature.

9. WHAT WE DON'T DO

This section enumerates categories of information that the Software never collects, never transmits, and never retains. It is intended as an explicit companion to Section 3, so that you can see not just what the Software does, but also what it does not do.

- No audio recordings leave your device. Microphone audio is processed by the speech recognition model on your CPU and is never uploaded to any server for any reason. If you keep audio saving enabled in the local transcript history (Section 3.4), a copy of the recording is stored encrypted on your own device only; it still never leaves your device. - By default, no transcribed text leaves your device. In the default configuration of the Software, the output of the speech recognition model is typed into the focused window, and the Software does not upload transcriptions to any server. The transcribed text may be stored in the local, encrypted transcript history on your own device (Section 3.4). It is not automatically uploaded. Section 6 describes explicit provider requests, including shorter preview samples and selected saved-text cleanup. Ordinary dictation skips cloud cleanup for transcripts of three words or fewer unless they contain a saved Boost term from your Dictionary. Remote requests go only to your selected provider over HTTPS; the provider may retain submitted content after the request ends. Explicit copying, export and destinations are separate user-directed actions. No transcribed text is transmitted to Lanreal or to the service providers listed in Section 5 as part of Whisperstream's transcription or cloud-cleanup pipeline. Text you deliberately submit to a destination application, Codex or Claude Code, or a GitHub issue is controlled by that destination. - No passive transmission of microphone input, typing, keystrokes, or clipboard contents. The Software does not intercept or transmit your keyboard or clipboard activity. - No telemetry, no analytics, error reporting, crash reporting, no usage tracking, and no feature-flag service. The Software does not integrate Sentry, PostHog, Mixpanel, Google Analytics, Plausible, or any comparable service. No automatic event streams, per-action tracking, or behavioural profiling are sent to any server. In the open-source edition, model-download connection data leaves your device through the model-host routes in Sections 3.3, 3.7 and 3.8. Optional cloud post-processing is separately controlled under Section 6. Built from source, the Software makes no application-update requests; the official installer build makes only those described in Section 3.2. External help is described in Section 3.12. This edition sends no licensing, rating, review or feedback requests. Text you deliver to other applications and Agent Speak's local assistant interactions retain the boundaries described in Sections 3.10 and 3.11. Communication with the local backend uses only the loopback interface and does not leave your device. There is no "opt out" for telemetry because there is no telemetry to opt out of; model downloads and user-initiated flows follow the controls described in Section 3. The content-free local access log described in Section 3.4 is likewise stored only on your device and is never transmitted. - No advertising identifiers. The Software does not collect, generate, or transmit any advertising identifier (such as IDFA, AAID, or similar). - No local network scanning. The Software does not scan your local network, enumerate devices on it, or probe for other services. - No persistent loopback-accessible endpoints beyond the local backend process. The local backend process binds exclusively to the loopback interface (127.0.0.1) so that no other device on your network can reach it, and it exposes no outbound telemetry. - No sale of personal information. Lanreal does not sell or rent personal information. See Section 13 for the CCPA-specific disclosure on sale and sharing. - No profiling or automated decision-making. The Software does not profile you, score you, rank you, or make

any automated decision that produces legal or similarly significant effects within the meaning of GDPR Article 22. - No cookies or tracking technologies. The Software does not use cookies, web beacons, pixel tags, local storage tokens, browser fingerprinting, or any other tracking technology to identify you, track your behaviour, or build a profile about you. The local communication between the Software's frontend and backend processes (over the loopback interface) does not use persistent cookies or session identifiers.

10. YOUR RIGHTS

Depending on where you live, you may have one or more of the rights listed in this section. Lanreal extends all of these rights to every Whisperstream user, regardless of jurisdiction, so that you do not have to prove residency in order to exercise a right.

Rights summary. The most commonly exercised rights, with the statutory basis for each, are:

- Right to know what personal information Lanreal holds about you and how we use it (GDPR Article 15 / CCPA Section 1798.110 / Canadian federal privacy law Principle 4.9). - Right to delete or erase personal information Lanreal holds about you (GDPR Article 17 / CCPA Section 1798.105). - Right to correct inaccurate personal information (GDPR Article 16 / CCPA Section 1798.106 / Canadian federal privacy law Principle 4.9.5). - Right to data portability in a structured, commonly-used, machine-readable format (GDPR Article 20). - Right to withdraw consent where consent is the applicable basis (GDPR Article 7(3)). The app permission for optional cloud post-processing can always be withdrawn as described in Section 6. - Right to complain to a privacy regulator (GDPR Article 77, CCPA, Canadian federal privacy law; see Section 15 for the supervisory authorities).

To exercise any of these rights, email Lanreal's Privacy Officer at support@whisperstream.io. There is no charge, no account required, and no in-app rights-request form. Lanreal will respond within the applicable Canadian 30-day, GDPR one-calendar-month and California 45-calendar-day periods, subject to the shorter commitments and permitted extensions described in the timelines at the end of this Section 10.

Rights under the European Union General Data Protection Regulation (GDPR Articles 15 to 22):

- Right of access (Article 15): you may ask Lanreal to confirm whether we process personal information about you and, if so, to provide a copy of that information. - Right to rectification (Article 16): you may ask Lanreal to correct any inaccurate personal information we hold about you. - Right to erasure (Article 17): you may ask Lanreal to delete personal information we hold about you, subject to the statutory exceptions in Article 17(3). - Right to restriction of processing (Article 18): you may ask Lanreal to restrict the processing of your personal information in the circumstances set out in Article 18(1). - Right to data portability (Article 20): you may ask Lanreal to provide your personal information in a structured, commonly used, machine-readable format where the processing is based on consent under Article 6(1)(a) or contract under Article 6(1)(b) and is carried out by automated means. - Right to object (Article 21): you may object at any time, on grounds relating to your particular situation, to processing of your personal information that is based on Article 6(1)(f) (our legitimate interests). If you believe that any processing by Lanreal that is based on Article 6(1)(f) affects you, you may object on grounds relating to your particular situation, and Lanreal will cease the processing unless we demonstrate compelling legitimate grounds that override your interests, rights, and freedoms. - Rights in relation to automated decision-making (Article 22): not applicable. Lanreal does not engage in automated decision-making that produces legal or similarly significant effects within the meaning of Article 22. - Right to withdraw consent (Article 7(3)): applies where consent is the applicable GDPR basis. Independently of processing-role classification, the app always preserves the cloud-permission withdrawal control: disable the feature through the Software's settings interface as described in Section 6.5, which stops all further transmission of transcribed text to the provider. Withdrawal of consent does not affect the lawfulness of processing already performed under your consent before withdrawal. Canadian consent and withdrawal requirements are separately explained below.

Rights under the California Consumer Privacy Act (CCPA):

- Right to know what categories of personal information we have collected about you, the sources from which we collected it, the business or commercial purposes for collecting it, and the categories of third parties with whom we shared it. You may also request the specific pieces of personal information we have collected about you. - Right to delete personal information we collected from you, subject to the statutory exceptions in Cal. Civ. Code Section 1798.105(d). - Right to correct inaccurate personal information we maintain about you. - Right to limit use of sensitive personal information: Lanreal does not request or use sensitive personal information for a purpose that triggers this right. A voluntary support message or GitHub issue could nevertheless contain sensitive personal information despite the instruction in Section 3.12; Lanreal handles such incidental content as described there. - Right to opt out of the sale or sharing of personal information: not applicable. Lanreal does not sell or share personal information for cross-context behavioural advertising, as described in Section 13 below. The disclosure that this right is not applicable is nonetheless provided. - Right to non-discrimination for exercising any CCPA right. Lanreal will not deny you the Software, charge you a different price, or provide a different level of quality because you exercised a right under the CCPA.

Rights under Canadian federal privacy law:

GDPR legal bases do not replace consent where Canadian law requires it. We explain material new purposes or disclosures before they begin and obtain the form of consent required in the circumstances. Built from source, the Software makes no application-update requests; the official installer build installs an update only after you accept it (Section 3.2). You can disable optional cloud cleanup. Declining a missing-model download prevents installation of that model; installed compatible models remain usable. You may contact our Privacy Officer to withdraw consent to processing under our control, subject to legal or contractual restrictions that we explain.

- Right of access to personal information Lanreal holds about you. - Right to correction of inaccurate personal information. - Right to challenge compliance with this Privacy Policy and with Canadian federal privacy law generally. Challenges are directed to the Privacy Officer in the first instance (see Section 15).

How to exercise your rights. To exercise any of the rights above, email Lanreal's Privacy Officer at support@whisperstream.io with a description of your request and enough information for us to verify your identity and locate your personal information (for example, the email address or GitHub account you used to contact us). Lanreal does not operate an in-app rights-request button in this version of the Software; the email channel above is the designated rights mechanism.

Verification. Because Lanreal does not maintain a user account database, identity verification for most requests will consist of confirming that the email address or account you use to contact us matches a record we can locate, or confirming enough details about your interactions with us that we can associate your request with specific personal information we hold.

Accuracy and unresolved challenges. We take reasonable steps to keep personal information under our control sufficiently accurate, complete and current for its purpose. We do not routinely refresh historical information without a continuing purpose. If an accuracy challenge cannot be resolved to your satisfaction, we record the substance of the challenge alongside the information.

Recipient follow-through. Where GDPR Article 19 applies, we communicate applicable corrections, erasures and restrictions to each recipient to whom we disclosed the personal information, unless doing so is impossible or requires disproportionate effort. On request, we identify those recipients to you.

Response timeline. Lanreal will acknowledge your request within a reasonable period and will respond substantively within 30 days of receipt, or within one calendar month if that is earlier for a GDPR request. Access and correction requests are free. GDPR Article 12(3) permits up to two further calendar months where necessary because of complexity or the number of requests, with reasons given within the first calendar month. Lanreal also preserves its existing shorter 30-day notification and 60-additional-day commitments where they apply. Any Canadian extension must separately satisfy Canadian law and be explained within the initial 30 days.

CCPA response timeline. For California requests to know, delete or correct, Lanreal confirms receipt within 10 business days and explains verification, handling and the expected response time. The substantive response is due within 45 calendar days, with up to 45 additional days where permitted and explained within the initial period. This does not lengthen an earlier or shorter response commitment that also applies to your request.

If Lanreal does not take action. We explain the reasons and your complaint and judicial remedies without delay, within 30 days of receipt or, for a GDPR request, one calendar month if earlier.

Authorized agents. California residents may use an authorized agent to submit a rights request on their behalf. If you do so, we may require the agent to provide written authorization from you and to verify their own identity.

11. CHILDREN'S PRIVACY

The Software is not directed to children. Lanreal does not knowingly collect personal information from children under the age of 13 in the United States (consistent with the Children's Online Privacy Protection Act, or COPPA), or from children under the age of 16 in the European Economic Area (consistent with GDPR Article 8). If you are a parent or guardian and you believe your child has provided personal information to Lanreal through the Software, please contact us at support@whisperstream.io and we will take reasonable steps to delete that information. The Software does not implement age verification because it does not require account creation, does not collect age or date-of-birth information, and is not directed to children.

12. SECURITY SAFEGUARDS

Lanreal implements security safeguards proportional to the sensitivity of the personal information the Software processes. This source edition limits model-download requests to ordinary connection information and keeps inference local except for separately enabled cloud cleanup. In particular:

- The Software requires no Lanreal account registration or activation. - External network requests initiated by the Software use HTTPS with the certificate-verification behaviour of the underlying HTTP library. The Software does not disable certificate verification. - Downloaded model artifacts are verified against pinned cryptographic checksums before installation. - The local backend process binds exclusively to 127.0.0.1 on a local port, so that no other device on your network can reach it. - Local configuration, logs, and usage statistics are stored under your Windows user profile with the access controls your operating system provides. - The local transcript history described in Section 3.4 separately encrypts the raw transcript, enhanced transcript, waveform peaks, and, if enabled, audio using AES-256-GCM. The AES data key is itself sealed using Windows user-scoped DPAPI. Windows normally limits decryption to the protecting user's credentials on that computer; a roaming profile can permit decryption on another computer. This protection does not isolate the key from processes acting with that user's authority. Lightweight index metadata needed for lookup and playback remains unencrypted. Existing plaintext waveform peaks from an older database schema are transactionally migrated to separately authenticated ciphertext when the data key is available; if the history is locked, migration is deferred and retried after unlock. The replacement of a legacy database value uses ordinary SQLite updating and is not represented as secure erasure of storage remnants. - When Lockdown Mode (Section 3.6) is on, the Software adds a password layer to the transcript history. A key derived from a password you choose (using the scrypt key-derivation function) and a separate key derived from a one-time recovery code each wrap the transcript encryption key using AES-256-GCM, on top of the at-rest encryption and Windows Data Protection API sealing described above. The transcript history locks automatically after an idle period you set, and repeated failed unlock attempts trigger escalating delays. Lanreal never receives your password or your recovery code. - For the optional cloud post-processing feature described in Section 6, credentials (API keys) that you supply are encrypted at rest using Windows user-scoped DPAPI (CryptProtectData). Windows normally limits decryption to the protecting user's credentials on that computer; a roaming profile can permit decryption on another computer. This does not isolate credentials from processes acting with that user's authority. The encrypted credential is stored under %LOCALAPPDATA%\Whisperstream\ with the access controls your operating system provides, and is not part of the bug-report log export described in Section 8, so it is not inadvertently transmitted when you submit a bug report to Lanreal. - When the optional cloud post-processing feature is enabled, each request to the

provider you selected travels over HTTPS with certificate verification enabled. Your credential is transmitted only as a request header on those requests, and only to the provider you selected. The Software does not transmit the credential to Lanreal, to any service provider or recipient listed in Section 5, or to any other recipient.

No security program can guarantee absolute protection against all threats. If you become aware of a security issue affecting the Software, please contact Lanreal at support@whisperstream.io.

12A. DATA BREACH NOTIFICATION

Lanreal assesses the reporting, individual-notification and record-keeping requirements of each applicable law separately. One jurisdiction's threshold does not limit another's requirements.

(a) Under Canadian federal privacy law, where a breach involving information under Lanreal's control creates a real risk of significant harm, we report to the Office of the Privacy Commissioner of Canada and notify affected individuals as soon as feasible after determining the breach occurred, in accordance with section 10.1 and the Breach of Security Safeguards Regulations (SOR/2018-64).

(b) We use available appropriate direct contact details for individual notice. Where the Regulations permit indirect notice, we use a public communication or similar measure reasonably expected to reach affected people. This can include a prominent website notice and other appropriate channels; absence of a direct email address does not by itself determine the notification method.

(c) Where GDPR Article 33 applies, we notify the competent supervisory authority without undue delay and, where feasible, within 72 hours of awareness, unless the breach is unlikely to result in a risk to individuals' rights and freedoms. Where Article 34 requires individual notice for likely high risk, we notify affected people without undue delay. Existing stronger notification commitments remain unaffected.

(d) California and other applicable breach-notification laws are assessed and met independently, including their timing and content requirements.

Under section 10.3 of the Canadian Act and regulation 6, Lanreal keeps a record of every breach involving personal information under its control for at least 24 months after determining it occurred, and makes the record available to the Office of the Privacy Commissioner of Canada on request.

12B. BUSINESS TRANSFERS

If Lanreal Technologies Inc. is involved in a merger, acquisition, reorganization, sale of assets, or bankruptcy, personal information we hold may be transferred as part of that transaction. If such a transfer occurs, the acquiring entity's use of your personal information will remain subject to the commitments made in this Privacy Policy. We will notify you of any such transfer and of any changes to the applicable privacy terms by updating this Privacy Policy (see Section 14) and, where feasible, by notice on the Whisperstream website. Where required by applicable law, we will obtain your consent before transferring your personal information to the acquiring entity.

12C. LAW ENFORCEMENT AND GOVERNMENT REQUESTS

Lanreal may disclose personal information to law enforcement, regulatory authorities, courts, or other governmental bodies where we are legally required to do so (for example, in response to a valid subpoena, warrant, or court order), or where applicable law permits disclosure and it is necessary to protect a person's life, health or security. We satisfy the conditions of the applicable legal permission, including any required notification. Lanreal will attempt to notify you of any such disclosure before it occurs, unless notification is prohibited by law or court order. Lanreal does not voluntarily provide personal information to any government surveillance programme.

12D. SURVIVAL

Sections 8 (How Long We Keep It), 10 (Your Rights), 11 (Children's Privacy), 12 (Security Safeguards), 12a (Data Breach Notification), 12b (Business Transfers), 12c (Law Enforcement and Government Requests), 13 (CCPA Notice for California Residents), 14 (Changes to This Policy), 15 (How to File a Complaint), and 16 (Contact Us) of this Privacy Policy, and any obligations arising from a data breach that occurred before termination, survive after you stop using or uninstall the Software for as long as Lanreal retains any personal information about you.

13. CCPA NOTICE FOR CALIFORNIA RESIDENTS

This section describes personal information handled in the preceding twelve months under the California Consumer Privacy Act and California Privacy Rights Act (the "CCPA"). We offer the California rights in Section 10 regardless of whether statutory business thresholds apply.

Categories, sources and purposes. The categories below correspond to Cal. Civ. Code Section 1798.140. Current app flows are described in Section 3.

- Identifiers: IP addresses and ordinary connection information for model downloads and, in the official installer build, update requests; and contact/account details in voluntary reports and correspondence. Sources are the device/network connection and the person submitting information. - Personal information under Section 1798.80(e): names and similar contact details supplied in submissions or correspondence. Other information in this category is not requested but can appear in a voluntary message. - Characteristics of protected classifications: not requested; they can appear in information someone chooses to submit. The mere availability of a freeform field does not mean every category was received. - Commercial information: not requested; it can appear in a voluntary message or attachment. - Biometric information: Lanreal does not receive voiceprints or biometric identifiers. On-device speech recognition transcribes audio without using it to identify the speaker; local audio and history remain under your control. - Internet or other electronic network activity information: the connections for delivery, chosen external visits and submissions described in Section 3. Optional cloud cleanup sends requests directly to the provider you choose under Section 6. - Geolocation data: the app requests no location data. Network recipients can infer an approximate location from an IP address under their own policies. - Audio, electronic, visual, thermal, olfactory or similar information: messages and attachments voluntarily supplied to Lanreal or GitHub. Local dictation audio and history are not automatically sent to Lanreal. - Professional or employment-related information: not requested; it can appear in a voluntary message or attachment. - Education information: not requested; it can appear in a voluntary message or attachment. - Inferences: Lanreal does not create profiles of your characteristics, preferences or behaviour from these records. - Sensitive personal information: not requested for ordinary support or reports. Incidental sensitive content is handled under Section 3.12 and applicable legal requirements.

We use these records for requested software delivery, responding to voluntary reports and support, handling privacy requests, and resolving claims under Section 4. Retention criteria for each category, including local data, are in Section 8. The local transcript history, audio and access log are not automatically uploaded. If you separately send content to Lanreal, it is handled as correspondence under Section 3.13.

Recipients and disclosures for business purposes. The following disclosures apply to the records and purposes described in Sections 3-5:

- Hugging Face and GitHub independently receive connection information for direct public-model delivery. GitHub also receives chosen browser visits and voluntary public reports, including the account details and content supplied. - Cloudflare receives connection information as Lanreal's service provider for the official installer build's update requests. - Google (Gmail) and Resend can receive identifiers and electronic message and attachment content supplied for email handling under Section 3.13. Additional categories depend on what you choose to include. - OpenAI and Anthropic can receive identifiers and message and attachment content that Lanreal submits through consumer subscriptions to help draft replies (Section 3.13). They receive it as third parties under their own terms, not as Lanreal's service providers or contractors. Lanreal pays for these

subscriptions and receives no payment or other valuable consideration for the content. You can ask us not to use these tools for your message. - Optional cleanup providers receive the user-directed requests in Section 6; those are separate from Lanreal's handling of correspondence.

Sale, sharing and sensitive information. Lanreal does not sell personal information for money or other valuable consideration or share it for cross-context behavioural advertising, and has not done so in the preceding twelve months. We do not knowingly sell or share information about consumers under 16. These statements do not imply age verification. There is no "Do Not Sell or Share My Personal Information" link for these practices. Lanreal does not request or use sensitive personal information for a purpose that triggers the CCPA right to limit.

Requests. Email support@whisperstream.io to exercise your rights to know, delete, correct or receive non-discriminatory treatment. Section 10 describes verification, authorized agents, response timelines and exceptions. Lanreal operates exclusively online and has a direct relationship with the consumers from whom it collects personal information; email is its designated CCPA request method under Cal. Civ. Code Section 1798.130(a)(1)(A). We update applicable preceding-twelve-month disclosures at least annually.

14. CHANGES TO THIS POLICY

We provide applicable privacy information when collecting information directly. For information obtained from another source, applicable GDPR Article 14 information is provided within one month and sooner where first communication or disclosure requires it, unless a documented legal exception applies. Before using retained information for a new purpose, we explain that purpose and the relevant additional information. Bundling this policy does not replace any required notice at collection or separate consent.

Lanreal may revise this Privacy Policy and publish a new version and effective date. Privacy Policy versions are independent of app and software-notice versions. A change is material when it changes how Lanreal collects, uses, shares or retains personal information; the version number alone does not determine that.

How you learn about changes. The policy bundled with your source revision is the policy supplied with that revision. Rebuilding newer source includes its bundled policy; the app does not automatically fetch newer policy documents. Existing packages retain the documents supplied with that package. If updated terms change rights or obligations, content processing remains blocked until the user reviews and affirmatively accepts the applicable terms. Closing, deferring, building, installing or continued use does not record acceptance. The most recent published version of this Privacy Policy is also available at https://whisperstream.io/privacy, which also links to the notices for other Whisperstream editions.

Service-provider and recipient changes. If Lanreal adds, removes, or replaces a party listed in Section 5, or materially changes that party's role or purpose, the change will be reflected in a new version of this Privacy Policy. Lanreal also publishes a public provider list at https://whisperstream.io/subprocessors and a companion RSS feed at https://whisperstream.io/subprocessors/feed.xml, both of which mirror Section 5 and the human-readable changelog Lanreal maintains for provider additions, removals, replacements, and material updates. Except for changes required for security, legal, or fraud-prevention reasons, Lanreal commits to publishing each prospective provider change to that page and feed at least thirty (30) days before it takes effect, so that you have a meaningful opportunity to exercise the right to object to processing under Article 21 of the General Data Protection Regulation, or the equivalent right of withdrawal of consent and accountability-based recourse under Canadian federal privacy law and the Personal Information Protection and Electronic Documents Act, before the change becomes operative. The page and feed are the canonical advance-notice channel; Section 5 of this Privacy Policy remains the authoritative source of truth for the current list.

15. HOW TO FILE A COMPLAINT

You may contact Lanreal at support@whisperstream.io about a privacy concern. You do not have to complete our process before exercising a statutory right to complain directly to a regulator. Lanreal's Privacy Officer will investigate your complaint and respond within the timeline described in Section 10. Lanreal commits to investigating all privacy complaints received and, if a complaint is found justified, taking appropriate measures including amending policies and practices where necessary.

Regulator routes include:

- European Economic Area: you have the right under GDPR Article 77 to lodge a complaint with the data protection supervisory authority of the Member State of your habitual residence, place of work, or the place of the alleged infringement. - United Kingdom: you may raise a concern with the Information Commissioner's Office at https://ico.org.uk. - Switzerland: you may report a suspected data-protection violation to the Federal Data Protection and Information Commissioner at https://www.edoeb.admin.ch under the applicable Swiss rules. - California: you may contact the California Privacy Protection Agency or the California Attorney General's Office for information about your rights under the CCPA. - Canada (federal): you may file a complaint with the Office of the Privacy Commissioner of Canada (the 'OPC') at https://www.priv.gc.ca/en/report-a-concern/, toll-free 1-800-282-1376. The OPC has the authority to investigate your complaint under section 11 of the Personal Information Protection and Electronic Documents Act, issue a Report of Findings, and make formal recommendations. If the matter remains unresolved after the OPC's investigation, section 14 of the Act grants you the right to apply to the Federal Court of Canada for a hearing. - Canada (provincial): if you are a resident of Quebec, British Columbia, or Alberta, your provincial regulator may have parallel jurisdiction. You may contact Quebec's Commission d'acces a l'information at https://www.cai.gouv.qc.ca, the Office of the Information and Privacy Commissioner for British Columbia at https://www.oipc.bc.ca, or the Office of the Information and Privacy Commissioner of Alberta at https://www.oipc.ab.ca.

Nothing in this section limits any other right or remedy available to you under applicable law.

16. CONTACT US

Questions, requests, and complaints about this Privacy Policy and about Lanreal's handling of personal information should be directed to Lanreal's Privacy Officer:

Privacy Officer Lanreal Technologies Inc. 18 King Street East, Suite 1400 Toronto, Ontario M5C 1C4 Canada

Email: support@whisperstream.io

Lanreal's Privacy Officer handles questions and rights requests about our processing and this policy's commitments. Section 2 explains our role. You may also contact your selected provider about information it handles directly; referral to a provider does not limit a request or remedy against Lanreal.

Accessibility. This Privacy Policy is available in Markdown format bundled with the Software, in plain text format installed with the Software, and in HTML format at https://whisperstream.io/privacy. If you need this Privacy Policy in an alternative format to accommodate a disability, please contact us at support@whisperstream.io.
